

## VNI West – delivering benefits for the community and Victoria

VNI West is an important infrastructure project to build a new transmission line between Victoria and New South Wales. TCV recognises that the project is causing concern in some communities and will continue to work closely with local landholders and communities across the draft corridor for the VNI West project as we progress.

### Why is VNI West needed?

As coal-fired power stations retire, we will need new sources of electricity to improve the reliability and security of supply.

New transmission lines are needed to connect power from renewable generation as well as new gas, hydro and batteries with our homes and businesses.

### What are the benefits of VNI West?

VNI West will deliver a range of benefits to local communities and more broadly, such as:

Harness renewable energy for Victorian homes.

Provide local jobs and business opportunities during construction.

Support training and skills development in rural communities.

Boost regional economic activity.

Strengthen the connection between Victorian and NSW power grids.

Ensure energy security as coal fired power retires.
